34. Computers – A computer is a machine that can be used for information processing. The computer is a generic term that describes a set of devices which carry out specific tasks, such as word processing, computing, or playing games, by the end of the 20th century, the computer had become an important tool in the business world, and it continued to grow in usage among households and within the academic.

Computers quickly became widely used in all kinds of technological applications, the development of the computer led to the development of the Internet, which has become an important communication tool for businesses and individuals

alike. In the 21st century, computers have become widely used for a number of reasons. Computers, both wired and wireless, use the memory, a processor, computer peripherals, communication mediums, Operating systems, programming languages, and different file-types in a computer system and networks are used to access, store, organize, process, and transmit information, typically for real time control of devices or for data storage. A computer can be an isolated system or part of a network that is linked to other systems or networks. There are many different models of computers that are based on different technologies. The term computer is a shortened form of the word calculating machine. Its origin dates back to the 19th century, the word derives from abacus and the French word calculator, Latin word computāre, which comes from com- and parere, to count. The first step in the history of computers was the creation of the first programmable mechanical computing device by British engineer Charles Babbage in the 1810s. The realization of this plan was delayed

by numerous factors, mechanical computers have a long history of development. Many were used as early as the 1940s, when electromechanical time-sharing systems were used, by the mid-1950s, the stored program concept was effectively applied to electronic digital computing. Digital computers made significant impact as they became prevalent in the 1980s, and continue to be a dominant presence. In contrast, the development of computers made little progress before the World War II. The connections between the civilian technologies in the 1930s were limited, such research led to military purposes for computing technology such as computing and ballistic prediction, but also later to be used in the World Wars use of early computers. In the early 1970s, personal computers using microprocessors would evolve into modern personal computers and from them, the present-day concept of a computer began to take shape with the development of minicom
