A: Assuming you are asking about Android on an Intel-based mobile device: Intel has been slow to get into the pro audio market. However, in the past five years, they have made steady inroads. Their presence at NAMM and CES is indicative of the products that will be available in the near future. I will make a bold statement and predict that Intel will make a big splash in the pro audio market over the next five years and that it will be much larger than the relatively tiny market that exists at this time. My reasons: 1) Intel has demonstrated that they can make a graphics processor that has

the power of a large PC processor at a cost that is comparable to mobile processors. This a competitive advantage over the likes of Arm, AMD and Nvidia. 2) Intel is looking at ways to make their process more energy efficient. Because of Moore's Law, the less power a processor uses, the more die area it requires and the higher the cost. Since mobile applications will be far more power hungry than desktop applications, this is a double-edged sword. It will be much easier for Intel to add embedded sound processing capability, which will make computers capable of serving as personal dj systems a reality. 3) Intel is already making efficient audio chips for other markets. Software encoding and decoding (H.264) is the most demanding application. OpenAL is a great interface for that, but it is too high level. Intel already has fine
