The form submits just fine and the person's attributes are saved to the database. Now, this form is just for demonstration purposes, so the user can see all the fields in the Person model, for the sake of aesthetic purposes. My question is, is it possible to add a checkbox to the form that saves a boolean of whether or not that person is married to one another? Obviously, I don't want to save the first_name and last_name because that would be redundant. Is it possible to display the checkbox in the form and submit it without it redirecting the page to where I want to go? A: true %> You can leave it null as a default value. false, :disabled => true %> About the Foundry The Foundry is a global asset management company that offers a full range of financial services to companies, banks and individuals through our subsidiaries. We are focused on building strong and rewarding relationships with our clients, and are continually investing in the future to enhance our capabilities and adapt to evolving market requirements. With a staff of 1,200 employees, ranging from board to professional staff, we have built a business that offers clients high-quality service and expertise at a competitive price. Finding a lender
