Tamil Nadu News Paper. RANGE OF PRACTICE OF THE CHINESE. Telugu New paper; Kandalur Vasantha Kumaran Kathai; Laser treatment of hereditary angioedema. Hereditary angioedema (HAE), an autosomal dominant inherited disorder, is caused by the absence or the diminished activity of C1 esterase inhibitor, a natural inhibitor of the enzyme complement system. It is characterized by recurrent episodes of mild to life-threatening cutaneous and subcutaneous edema, easy bruising, and abdominal pain. The outcome and prognosis depend on the rapidity of the therapeutic intervention. We present the patients with HAE that were referred to our university clinic to receive a focused laser therapy because they had failed to respond to medical treatment and/or repeated blood transfusions. 2. Σ is a real hypersurface with geodesic foliation, of class $h(1,1)=2$. Then $b_2=0$, $b_3=0$ and $b_4=1$; so, $c_2=1$, $c_3=2$, $c_4=3$ and $c_5=1$, according to ([formula]). Conclusions ===== We considered non-minimal hypersurfaces of coindex 2 in \mathbb{P}^5 , satisfying $c_2=c_3=1$, and proved that such hypersurfaces have a real second Chern class. In many cases, such hypersurfaces are deformations of minimal ones, since $b_4=0$ implies $c_4=1$. Another example of this type of hypersurfaces is the canonical embedding of a quadric surface into \mathbb{P}^5 . We only proved the statement for hypersurfaces of general type, so we have a first step towards the classification of non-minimal hypersurfaces. Furthermore, we showed that $b_4 \geq 0$ if and only if c_4
