Category: Windows multimedia software Category: MacOS multimedia software Q: Does this Mexican method of picking a

single random number from a group work? There is a Russian roulette game that has a twelve shot revolver and a box of two bullets. The two bullets are randomly placed in the revolver, and one of them is removed. The rules are as follows: You must pick a single bullet from the box of bullets, and then pull that single bullet out of the revolver. This process must be repeated until either you shoot yourself or you pick a bullet from the box that is the same as the bullet you pulled out of the revolver. You can choose either method of

picking a bullet. Method 1: Pick a bullet from the box first, and then pull it from the revolver. Method 2: Pull a bullet from the revolver first, and then choose a bullet from the box. The question is: Is Method 1 superior, or is Method 2 inferior, or are they equivalent? Specifically, I think Method 2 loses the advantage of choosing which bullet to pull from the revolver first. A: Answering this question is a complicated matter. The problem can be restated as: Given a set of n elements. Select one without replacement until you pick an element that has

already been picked. An answer is known for $P = NP$, so there is a solution for $n = 2$ that can be "simplified" into the following: If there exists a function f that takes the set of n elements as input, such that The smallest input which returns an output of 0 is less than or equal to n The smallest input which returns an output of 1 is greater than or equal to n If the smallest input is k , then there are at most nk duplicates of it. Then there is a solution for $n = 2$. The proof given for $n = 2$ uses time and space (with the asymptotic form

of the Ramsey number, H and Balle- Shallit's result) to show that the answer to this problem is P, ie $3^*(2)$. There exists a solution for $n = 5$ (see this paper, it is quite hard to find
