I would rather have a PC that does not look like a PC. In other words, I would much rather have a Mac than a PC. I hate having to open a piece of software and wait minutes for it to load. I would rather have my money go to someone to develop faster technology so I can game at high-frame rates. "I have a Samsung Galaxy smartphone with a touch screen and I use it for what is important to me. Most of the time, I do not play games or watch videos, but I do like to post to Facebook, check email, write papers, etc. My goal is to do as much as possible on the phone and get the same utility from a smaller, lighter device." —Gilda Berg, a librarian and information professional SPECIAL DEALS MEMORY EXPLAINED While the size of your memory is not likely to be an issue in terms of storage, how you use it is very important. The amount of RAM (Random Access Memory) in your computer is a figure that indicates the memory capacity of the system. Of course, it is not the

only factor to take into consideration, but it can be considered to be an important one when it comes to deciding on how to buy RAM. The amount of RAM you need depends on how much memory your system needs. The more you use, the more RAM you will need. This is because RAM is generally used to store the main components of your computer, such as applications, your operating system, files, etc. On the other hand, a system with a small RAM capacity will be much more slower to perform tasks compared to one with a large capacity. Tips to know * * * RAM Tip # 1 RAM is rated for the number of gigabytes that you have stored there. Therefore, the number of gigabytes of RAM is how much information your computer can hold at once. Windows XP recommends you use 4 GB or 6 GB RAM for a standard installation
