keyboard macro manager. It allows you to define frequently used sequences of keystrokes. You can repeat the same action in an easier way. keyboard macro manager Description: keyboard macro manager. It allows you to define frequently used sequences of keystrokes. You can repeat the same action in an easier way. Keyboard macro Manager (KMM) version 2.1 Keyboard macro Manager (KMM) is a program that helps you to save frequently used keyboard macros (short sequences of keyboard keys). Keyboard macros are saved in a special file (.kmm), which you can open from KMM.

The software allows you to create keyboard macros that you can save to this file, set them as a keyboard shortcut, and run the macro on double-click. You can also send the macro to the clipboard and copy it to the Clipboard to send it to other programs that allow you to run macros. Support for Word, Excel, PDF, RTF, HTML, Visio, PowerPoint and many others. Screenshots: Installation (very easy): The program is divided in three main sections. Section 1 is the edit-panel where you define the actions of the macros, their names, and their start and end keys. To define the macro, you can use one of the four standard programming languages that are included with the software. Section 2 shows the list of your keyboard macros and you can add, remove, and edit them. Section 3 is the edit-panel where you define the actions of the macro, their names, and their start and end keys. To define the macro, you can use one of the four standard programming languages that are included with the software. Editing macros with your mouse (you can drag the macro name to the edit-panel to edit it): Keyboard macros allow you to define short sequences of keystrokes. A macro is easy to run by double-clicking the file name. You can also send the macro to the clipboard and copy it to the clipboard to run it in another program. Keyboard macros are stored in a special file (.kmm), which you can open from KMM. Keyboard macros are created using one of the four included languages. You can also manually create a macro using any of the standard programming languages included in the program. You can run a macro manually by double-clicking the macro file. The following keyboard macros are included in KMM: Insert 1d6a3396d6

Simple Port Forwarding is a free port mapping and forwarding program that allows administrators to make PCs behind a router or NAT visible for someone outside the LAN. It can be used with any router, that supports TCP/IP, or even with a wired/wireless modem. Simplest way to map IP Simple Port Forwarding is the simplest way to map any TCP/UDP port on your network (on router or modem). It supports various types of routers and modems and is very easy to use. The program allows you to map both static and dynamic IPs. You can map many ports, each of them can be mapped for different IP addresses or at a different time. Supported Routers and Modems Simple Port Forwarding can be used with any router that supports TCP/IP. You can use it even with a modem/router that does not have any IP address assigned to it. It can be used with Windows, Windows Mobile, MacOS or Linux (any, just the one where the port forwarding is set up). Simple Port Forwarding Features Simple Port Forwarding can be used for mapping IPs for: * Static IP addresses (IP addresses which do not change in time). * Dynamic IP addresses (IP addresses that change every time the client computer is restarted). * Windows, Linux and Mac OS X computers behind a router/modem. * Windows clients on wireless networks. * Windows Mobile clients on 3G networks. * Any other devices that run a

TCP/UDP client. * Wireless routers and modems. * Internal devices with embedded web servers.

Simple Port Forwarding Capabilities Simple Port Forwarding supports all TCP/UDP ports in the 40000-60000 range. It supports the following types of port forwarding: • TCP/IP • TCP and UDP (same port) • TCP or UDP (different ports) • TCP and UDP (different ports) It also supports: • IPs of either static or dynamic nature. • Any IP address range or set of ranges. • Dynamic IPs that change every time the client computer is restarted. • Any number of ports can be mapped for any number of IP addresses. • Any number of clients can be connected at the same time to the same port. • Static and dynamic IPs can be mapped simultaneously to the same port.

Simple Port Forwarding Map Simple Port Forwarding has two tabs: Forwarding Rules and Ports. The first tab allows you to map IPs to ports. In the second tab you can view all open TCP/UDP ports. Each port has two columns: Source IP and Destination IP. To configure port forwarding, click on the Forwarding Rules tab, select a source and destination IP and click Add Port to add a new port. You can then modify the details of the port.
