Image Mounter is a utility that will mount disk images, or images of disks, in order to enable you to get at them in your Windows system. It has to be noted that you cannot mount disk images the way you mount physical disks - typically by hitting Ctrl+L and choosing to mount the disk "as a physical volume". Instead, Image Mounter creates a folder on your Windows system, in the folder that is named with the same as the mounted image, and there you will find a virtual volume that allows you to access the contents of the disk image. What is disk image? Disk image is a method of transferring data from one physical computer (host) to another (target) computer. In the initial phase of the development of the Image Mounter utility, we worked on a customer's requirement to get at the contents of his D:\ drive (that is the disk image of the C:\ drive). He didn't want to use the traditional way of mounting the drive by choosing the "physical drive", and thus we developed a utility that will allow him to access the files on the drive. The disk images are very useful in case you need to make backup of your data and transfer it to another computer. Disk images are often used by forensics experts who need to copy their data to a new computer. The Image Mounter is useful for the same purpose. Ways of Mounting Disk Images Using Image Mounter utility Use the imount.bat file. This is the easiest way to mount a disk image. It will read the parameter file (imount-parameters.txt) and the disk image in the specified drive. Parameters that the imount.bat file uses are: drive letter: Drive letter of the disk image to be mounted. file name of the disk image: If the file name contains spaces or if it is greater than the maximum length of the file name you must use delimiters, for example, . q: The driver will ask "Yes" or "No". You can press Y or N to mount the disk image. y: The driver will ask "Yes" or "No". You can press Y or N to

mount the disk image. Example: `imount.bat /home/mail /Volumes/mail.img y:` I want to mount the disk image of a file named `mail.img` that is found on the D drive. I want to mount the disk image and make it a volume on the `6a5afdab4c`
